

гексагональная ячейка Вороного, $|N(x)| = 6$

The diagram shows a honeycomb lattice of light gray hexagons. A central hexagon is highlighted with a thick black border and is shaded light gray. This central hexagon is divided into six smaller triangles by dotted lines that meet at a central black dot. Each of these six triangles is also shaded light gray. At each of the six vertices of the central hexagon, there is a small gray dot. An arrow points from the label $a = h_L$ to the top-right edge of the central hexagon.

$$a = h_L$$
